

HARIKARAN CHETTIYAR

LINUX SYSTEM ADMINISTRATOR

Pune, India | harikaran.chettiyar@gmail.com | hari-pi.com | github.com/Hari-Pi

PROFESSIONAL SUMMARY

Computer Science graduate with hands-on Linux systems experience from self-hosted infrastructure, containerised services, and automation tooling. Administers Linux across Debian, Fedora, and Arch package families, hardens internet-facing services, and scripts operational workflows in Bash, PowerShell, and Python. Six months of professional experience combining software delivery with hands-on management of on-premises IT infrastructure, including workstations, networking, user access, and hardware support.

TECHNICAL SKILLS

Operating Systems	Linux (Debian/Ubuntu, Fedora, Arch families), Android/AOSP
Administration	Package and lifecycle management (apt, dnf, pacman), systemd services, privilege and sudo handling, filesystem, partition and boot troubleshooting
Security	Service hardening, least-privilege and loopback-only exposure, read-only container filesystems, credential hashing, auth throttling, HTTPS/TLS termination
Scripting	Bash, Zsh, PowerShell, Python, JSON-driven configuration, unattended provisioning, Git, GitHub Actions CI/CD
Infrastructure	Docker, Cloudflare Tunnel, reverse proxies, subdomain service routing, Tailscale, DNS and domain administration, self-hosted home server
Monitoring	Glances dashboards across self-hosted services, log inspection, resource troubleshooting

PROFESSIONAL EXPERIENCE

Full-stack Developer Intern | Averka Data Academy

Jan - Jun 2026

On-premises IT support | Next.js | Supabase | DNS and TLS setup

- Delivered a production platform end to end over a six-month internship, including deployment, custom domain and DNS configuration, HTTPS setup, and handover to the client team.
- Managed the organisation's on-premises IT infrastructure alongside the software work, covering workstation setup and maintenance, network and connectivity troubleshooting, user accounts and access, and day-to-day hardware and peripheral support.
- Implemented role-aware authentication and PostgreSQL-backed data flows for user accounts, sessions, and permissioned administrative access.

INFRASTRUCTURE & SYSTEMS PROJECTS

TunnelPane - Hardened Self-hosted File Transfer Service

Node.js | Docker | Cloudflare Tunnel | Bash | PowerShell | MIT

- Designed a file service that removes the need to expose SSH or forward inbound router ports, binding to loopback only and reaching users through an HTTPS reverse proxy or Cloudflare Tunnel.
- Hardened the deployment with a read-only container filesystem, SHA-256 credential hashing, authentication throttling, and rejection of path-traversal, hidden-segment, and oversized-name requests.
- Wrote cross-platform terminal clients in Zsh and PowerShell that authenticate at runtime with masked input, so the publicly fetched launcher scripts carry no embedded credentials.

Sys-Config - Cross-distribution Linux Provisioning

Bash | JSON | jq | apt | dnf | pacman

- Built a configuration-driven provisioning utility that detects the host package manager and reproduces a defined machine state across Debian, Fedora, and Arch based systems.
- Implemented dependency bootstrapping, root and sudo privilege handling, and pre-flight validation so configuration errors surface before any package operation modifies the system.

Linux on Commodity Hardware - Droidian Server Build

Linux kernel | Droidian | Docker | Glances | Tailscale

- Modified and rebuilt a device kernel to run a Droidian-based Linux userspace, debugging boot, partition, and image-deployment failures across repeated flash cycles.
- Operated it as a low-power self-hosted server running containerised services behind per-service subdomains, with Glances for unified system health and Tailscale for secure remote access.

EDUCATION

B.Tech in Computer Science | Ajeenkya DY Patil University

2022 - 2026

Pune, Maharashtra | CGPA: 8.06
